

The screenshot displays the AWS Management Console interface for the EC2 service. On the left, there's a navigation pane with various options. The main content area is titled "Instances (1) Info". It features a search bar, a refresh button, and several action buttons like "Connect", "Instance state", "Actions", and "Launch instances". Below these, there's a table listing the details of the instance(s). The table has columns for Name, Instance ID, Instance state, Instance type, Status check, Alarm status, Availability Zone, and Public IP. A single instance named "py-app" is listed with ID "i-01821dfa59fe48b9f", in a "Running" state, of type "t3.micro".

Name	Instance ID	Instance state	Instance type	Status check	Alarm status	Availability Zone	Public IP
py-app	i-01821dfa59fe48b9f	Running	t3.micro	3/3 checks passed	View alarms +	us-east-1d	ec2-54-9...

3. Install Python

Install Git

```
sudo yum install git -y
```

Clone your project repository

```
git clone <your-url>
```

Go into your project folder

```
cd docker_python_flask-project
```

Install Python pip

```
sudo yum install python3-pip -y
```

Install Flask

```
pip3 install flask
```

Run your Flask app

```
python3 app.p
```

```
aws [Search] [Alt+S] United States (N. Virginia) Account ID: 3750-0407-1051 rupesh1201

4. Test public ip

To access from **your laptop browser**, you need to use the **EC2 Public IPv4 address**:

`http://<ec2-public-ip>:5000`

5. Create Target Group

Target type: **Instances**

Protocol: **HTTP**

Port: **5000**

6. Create Load Balancer

7. Test DNS

Once created, AWS will give you a **DNS name** for the Load Balancer. Copy this and past browser and see.
